**Subject:** NE T-Hangar contaminated soil

The demolition contractor excavated about 50 cubic yards of contaminated soil from the north side of the NE T-hangar site today where the earlier boring had identified some contamination. Olympus Environmental was present and took some samples for lab work. We may get the results on Friday.

The contamination was shallow 1-4 feet and seemed to be from a past dumping or spill. We have covered the waste pile with plastic. When we get the results back we will know if we have removed enough soil or have to do more excavation. Olympus was doing some field sheen tests so we think we may have removed enough. Since it was heavy oils at 3800 ppm, we will likely have to haul it to Fife for thermal treatment. If this is all of the contamination, we are fortunate.

I'll inform you of the test results when I get them.
